

ALLERGY

Hello, dear viewers. Today's part of the internet television series ATADEP will deal with a very serious theme, which is allergy. According to the latest research, 20-30% of the population of developed countries suffers from allergies, and this percentage is constantly growing. The Joalis detoxification preparations can be a solution to this health problem. Dr. Jonáš, founder of the company, will tell us more. You have the floor, doctor.

At this point, everyone is expecting me to start talking about allergies to pollens and perhaps name birch, plantain, wormwood and lots of other plants, like we learn in pollen reporting. Then I should talk about foodstuffs, about milk, eggs and gluten, like we see it today on menus which are obliged to display allergens. I could talk about animal hairs, about mites, in short about a large number of allergens, because basically any foreign protein can become an allergen, and because the immune system must always react to, and remove, the foreign protein. An organism cannot leave a foreign protein inside itself; it becomes a toxin, and that is why it must be removed by the immune system. Of course, this only happens if the immune system is working correctly. If it is not working correctly, it triggers a disproportionate reaction. "Disproportionate" - it's such a nice word. A more precise description would be "hysterical" reaction, because the organism suddenly begins to behave as if it was being attacked by a huge number of dangerous toxins. Thus, it begins to secrete massive amounts of substances that are supposed to prevent this, most of all histamine, and even begins to activate phagocytes, i.e. blood cells which are supposed to remove these proteins. In short, the reaction is complete disproportionate and we then perceive it as inflammation. Mostly it involves an inflammation in the airways, but the inflammation can also be on the skin, in the intestine, or you may even encounter a brain allergy, which of course manifests itself in the nervous system.

But I'm not going to talk about individual allergens, or about how the diversity of allergens plays a certain role. After all, if someone proceeds in this way, the result is zero, which we can actually see around us. The allergy then only has a symptomatic solution, i.e. a suppression of histamine production in the form of antihistamines or a suppression of the inflammation in the form of medicines with a corticoid effect. This then indicates that the allergy itself is not officially curable.

Of course, this is not true if we look at it from a different perspective, from the perspective of our nervous system. Once again it is our brain that decides on the immune system's reactions, not the other organs or body parts. In this case, the brain is again that supreme "director" which organizes and controls the entire immensely complicated immune system. These reactions are not at all random, or uncoordinated, because a certain part of the brain which is called *lobus parietalis* and forms a part of the cerebrum - the telencephalon - controls the entire operation of the immune system, and not just in the case of allergies. If this control mechanism malfunctions, a disorder sets in in the immune system's reactivity. And it is one of these disorders that is described as an allergy. Otherwise we can also encounter other disorders, for example atopy as we know it in eczema, but that's a

completely different matter. Or, for example, we can come across autoimmune disease, which again is something completely different. But it always involves a disorder of the functioning of the immune system.

If we want to get rid of the allergy, we have to get into the area of the *lobus parietalis* and work there. That is where the programme which controls the entire immune reaction mechanism is located. A programme which may one day be entered into a computer. That is why it is a great help to us when we imagine that this part of the brain is programmed. In its own way, it involves a microchip or set of microchips, which are programmed in a certain way and which can also malfunction. And while we're comparing the brain to a computer, I even heard that every computer is subjected to millions of attacks every day, by various hackers, fraudsters and so on. Our brain is also exposed to similar attacks. And what is most frequently used to disrupt a computer programme? It's called a computer virus, i.e. something that breaks down the programmes we store in the computer. The same thing actually happens in the brain, and in this case we can understand the term "computer virus" to mean various toxins that are capable of disrupting the programme in this part of the brain. There can be several of these toxins, but the main role will be played by microorganisms, as the greatest enemy and opponent that we encounter on Earth.

To those who want to understand the problem of allergy, I recommend that they watch one of the parts in our series which discusses intestinal symbiosis and dysbiosis, because treatment of the intestinal environment belongs to such a fundamental and important introduction to the treatment of allergies. After all, intestinal toxins disrupt and weaken the function of the nervous system as a whole, and of course also the function of the entire immune system.

But let's deal with the part of the brain which is called the *lobus parietalis* (parietal lobe). Just like in other disorders, this part of the brain will be attacked primarily by microorganisms. These microorganisms can occur in two forms. Why in two forms? There may be more of these forms, but at present we know two. Microorganisms must get into the human body in order to propagate. That means that the environment that they need for propagation is the human organism. Our immune system takes action against this; it's supposed to eliminate every microorganism, but in reality this is not the case. Firstly, our immune system does not always work optimally, perhaps even due to intestinal dysbiosis, and, secondly, microorganisms have various "tricks" to fool the immune system and become invisible to it. And one of the ways of making the human organism into a good place for propagation, a good home and a suitable environment is to weaken the immune system, so that it cannot eliminate potential raids by other microorganisms. It is the very part of the brain that we are talking about that serves as a defence against this strategy.

That means that microorganisms get into this part of the brain, and they can hide here in two forms, one of which is called a **microbial deposit**. This is a highly complicated form, because the microbes are hidden in the deposit and coated with material which is impermeable to the immune system and to other substances, for example antibiotics and other medicines, and therefore they are indestructible. If we want to get rid of them, we must

be able to break down this coating and reach the content of the deposit, i.e. the microorganisms themselves. For this we have to use a certain tactic, a certain detoxification procedure, i.e. always several preparations. Each of these preparations has a certain function, in this case mainly the function of breaking down this case which forms the coating of the microbial deposit.

The other form in which microorganisms exist in the human body are **chronic infections**, which can take the form of whole microorganisms or their fragments, meaning pieces that carry their DNA, i.e. genetic information, which in the case of microorganisms is very simple and can be transmitted by mere fragments of these microorganisms' bodies.

We must remove these burdens from the brain so that the "microchip" can again function the way it was originally genetically programmed, as nature (or someone else) created this function, to protect us against the danger of foreign proteins, which can enter our bodies via food, inhaled pollen, various other protein impurities, etc..

In the case of a microbial deposit, we will proceed in the following manner.

We'll begin with the SUPERTOX preparation. This is a universal preparation for the entire organism, which releases toxins from any tissue in our organism. Because we apply holistic medicine, we avoid preparations that function only specifically, in isolation. Within the scope of holistic medicine we must function holistically, which means that the entire organism must be affected. That is why the preparations will often be repeated. This is not because it was not possible to create other preparations, but because the more developed the preparation is, the wider scope it has.

Another preparation, NODEGEN, which operates by breaking down emotional ramparts - so-called psycho-cysts - works in a similar manner. This is the emotional "coating" which prevents the organism ridding itself of a certain microbial deposit.

The third preparation will be CRANIUM. This preparation does not have a holistic effect, which means that it is not as developed. It may be more developed in the future. It works on a specific, relatively broad area of the brain, and we will also hear about it in other parts of our series. In this case, we need it to break down this deposit in the very area of the *lobus parietalis*.

This is one form of treatment. The preparations are taken at the same time, orally; 10 drops 2x a day on an empty stomach for adults. The important thing about these preparations is that they continue to work for many years, maybe even your whole life, so they're not preparations that we have to take constantly or repeatedly, as we are accustomed to doing with other medicines. For children, we rub these preparations on the skin, for example we can apply a few drops to the inside of the forearm, the tummy or the neck, and then we rub the fluid into the skin with a few strokes of our fingers. This simple application method is just as effective as using the preparation orally.

It may happen that the cause of the malfunction of the *lobus parietalis* is not a microbial deposit, but a chronic infection.

And, in this case, we must again turn to universal preparations, which deal with the microorganisms that appear most frequently in the nervous system. After all, not all microorganisms specialize in the nervous system.

Thus, we again begin the treatment with the SUPERTOX preparation, and continue with the SPIROBOR preparation for the removal of borreliae. We then continue with the ZOOINF preparation, which contains mainly the *Bartonella* and *Ehrlichia* microorganisms, and the ANTIVEX preparation, which is aimed at viruses. Of course, many other microorganisms also exist, but these are not usually found in the nervous system and do not cause chronic infections in it. Also taken into consideration is the MINDDREN preparation, which has a universal capability to rid the organism of the burden of so-called inorganic toxins, among which we mainly count toxic metals (e.g. mercury, aluminium, lead, cadmium and others), which can also become a type of "computer virus", i.e. a toxin that disrupts the operation of nerve cells in the brain.

Thus, we have two detoxification options, as they are stated here. But, just so we don't have it so simple, allergy most frequently manifests itself in the respiratory tract which, according to the principles of traditional Chinese medicine, is closely connected to the skin, so we can put allergic manifestations on the skin into context with the lungs. The intestine is also connected to the respiratory tract, so the triad of ancient Chinese medicine - "respiratory tract – skin – intestine" is actually the most frequent target of allergic reactions. It is then often necessary to also intervene in these target organs, and remove the microbial burdens which occur in them.

And here it's going to be quite simple. For **deposits** in the airways we will use the RESPIDREN preparation, for the intestine we will use COLIDREN and for the skin we will use CUTIDREN. In the case of **chronic infections** we will use the preparations which I already spoke about, and which work in the entire organism. I would like to add just one other preparation, which is also applied in the respiratory tract, on the skin or in the intestine quite often, and this is the NOBAC preparation, which affects a very broad scale of microorganisms, such as various types of cocci, bacilli, bacteriae, chlamydiae etc..

Thus, four preparations are taken into consideration here, three of which we have already used to deal with burden in the brain, and we will use the NOBAC preparation to deal with burden in the lungs, skin and intestine. Of course, I refer to intestinal symbiosis again and again, because its detoxification should precede the detoxification of any health problem. Of course it's enough to detoxify it once; we do not have to perform the detoxification repeatedly for every health problem.

And finally, to make it even more complicated, we may encounter one more type of burden in the nervous system, which at the start will probably be slightly incomprehensible, because people don't normally hear anything about it. The nervous system is composed of nerve cells, **neurons**, and of so-called **glial cells**. Thus, the nervous system is so simple that it contains only two basic types of cells. While we know quite a bit about neurons and everyone has heard about them at some stage, most people don't know anything about these glial

cells, of which there are more in the nervous system than neurons. And the allergic situation may be complicated by the fact that the burden is not in the neurons, but in the glial cells. The glia ensure that the neurons receive certain nutrition, a certain service, so that they can rid themselves of their waste substances. But we will leave a more detailed analysis for another time. Thus, in a certain number of allergy cases, detoxification may be more difficult. There aren't many of these cases, but if we aren't aware of this we will not always be able to achieve the necessary result.

If we want to clean out the **glial system**, we will use the NODEGEN and MEZEG preparations, and we will definitely do well to also use the MINDDREN and NON-GRATA preparations.

We already spoke about the NODEGEN and MINDDREN preparations. The MEZEG preparation is aimed directly at this glial system, and the NON-GRATA preparation is aimed specifically at various burdens created as a result of the presence of microorganisms, and thus also as a consequence of vaccination. This is because vaccinations use antigens, which are one of the parts of the NON-GRATA preparation.

When I speak about three to four possible treatments, it does not mean that everyone must undergo these treatments. But if we want to perform a truly comprehensive detoxification of allergies with a certain result, we will apply the treatments I mentioned here. It also has one more indisputable advantage, which is that all these preparations are not specifically anti-allergically targeted. They are holistic preparations which understandably have an effect on the entire organism, and that means that we will rid ourselves not just of the allergic reaction, but also work with other problems, and eventually even with potential problems. Thus, it is both prevention and work with immunity, which will be very, very worthwhile for us, because immunity is our greatest partner in life. It can protect us against external environmental influences, as well as against the danger that lies in wait for us in the form of various microorganisms and other foreign substances.
